Bacterial glycosyltransferase can be used to catalyse the formation of oligosaccharides that are identical to the corresponding mammalian structures and are easier and less expensive to produce in large quantity, compared to the mammalian glycosyltransferase. The bacterial origin of the enzymes facilitates expression of large quantities of the enzymes using relatively inexpensive prokaryotic expression systems. (Updated on 15-SEP-2003 to standardise OS field)

The invention comprises the amino acid and coding sequences of Campylobacter jojuni proteins. The C. jejuni proteins of the invention may be either an acyltransferase; glycosyltransferase; GalNAc (N-Acetylgalactosamine) transferase; galactosyltransferase; GalNAc (N-Sialyltransferase; sialic acid synthase; cytidine 5'-monophosphate (CMP) sialyltransferase; acetyltransferase; The C. jejuni DNA and protein sequences of the invention are useful for ganglioside synthesis, studying ganglioside mimetics, and for designing oligomucleotides to inhibit ganglioside mimetics that can mask the pathogen's from the host's immune system. The C. jejuni oligosaccharides of the invention may be used as metastasis). The present DNA sequence represents a Campylobacter jejuni gene of the invention

The invention comprises the amino acid and coding sequences of Campylobacter jejuni proteins. The C. jejuni proteins of the invention may be either an acyltransferase; glycosyltransferase; GalNAc (N-Acetylgalactosamine) transferase; glycosyltransferase; GalNAc (N-Setylgalactosamine) transferase; glycosyltransferase; sialic acid synthese; cytidine S'-monophosphate (CMP) sialytransferase; sialic acid synthese; cytidine S'-monophosphate (CMP) sialic acid synthetase; acetyltransferase. The C. jejuni DNA and protein sequences of the invention are useful for ganglioside synthesis; studying ganglioside mimetics, and for designing oligonucleotides to inhibit expression of Campylobacter enzymes involved in the biosynthesis of ganglioside mimetics that can mask the pathogen's from the host's immune system. The C. jejuni oligosaccharides of the invention may be used as diagnostic reagents (e.g. to locate areas of inflammation or tumour metastasis). The present DNA sequence represents a Campylobacter jejuni
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New glycosyltransferases from Campylobacter, useful for synthesizing gangliosides and ganglioside mimetics, and in studying the pathogenesis mechanisms of organisms that synthesize ganglioside mimetics.
GalNAc transferase; N-Acetylgalactosamine transferase; galactosyltransferase; sialyltransferase; sialic acid synthase; cytidine S'-monophosphate sialic acid synthetase; CMP sialic acid synthetase; Ganglioside synthetase; ganglioside mimetics; inflammation; tumour metastasis.

campylobacter jejuni proteins. The C. jejuni proteins of the invention may be either an acyltransferase; glycosyltransferase; GalNAC (N-hambetylgalactosamine) transferase; glycosyltransferase; GalNAC (N-sialyltransferase; sialic acid synthase; cytidine 5'-monophosphate (CMP) sialyltransferase; mail acid synthetaes; acetyltransferase. The C. jejuni DNA and protein sequences of the invention are useful for ganglioside synthesis; studying ganglioside mimetics, and for designing oligomucleotides to inhibit ganglioside mimetics, and for designing oligomucleotides to inhibit ganglioside mimetics that can mask the pathogen's from the host's immune system. The C. jejuni oligosaccharides of the invention may be used as indignostic reagents (e.g. to locate areas of inflammation or tumour metastasis). The present DNA sequence represents a Campylobacter jejuni gene of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         192

chemo-enzymatic synthesis of oligosaccharides, including gangliosides and other oligosaccharides that have biological activity. The enzymes and nucleic acids that encode them are useful for studies of the pathogenesis mechanisms of organisms that synthesize ganglioside mimics, such as C. jejuni and the nucleic acids are used as probes to study expression of genes involved in ganglioside mimetic synthesis. Antibodies raised against the glycosyltransferases are also useful for analyzing the expression patterns of these genes involved in pathogenesis. The nucleic cids are also useful for designing antisense oligonucleotides for inhibiting expression of the Campylobacter enzymes that are involved in the biosynthesis of ganglioside mimics that can mask the pathogens from the biosynthesis of ganglioside mimics that can mask the pathogens from the biosynthesis of ganglioside mimics that can mask the pathogens from the biosynthesis of ganglioside mimics that can mask the pathogens from the biosynthesis of ganglioside mimics that can mask the pathogens. Go reagents or as therapeutics and as immunogens for producing antibodies. Bacterial glycosyltransferase can be used to catalyse the formation of oligosaccharides that are identical to the corresponding mammalian structures and are easier and less expensive to produce in large cargin of the enzymes facilitates expression of large quantities of the enzymes using relatively inexpensive prokaryotic expression systems.

New glycosyltransferases from Campylobacter, useful for synthesizing PT gangliosides and ganglioside mimetics, and in studying the pathogenesis PT mechanisms of organisms that synthesize ganglioside mimetics.	Disclosure; Page 98; 107pp; English.						system. ine C. jejumi oligosaccharides of the invention may be used as diagnostic reagents (e.g. to locate areas of inflammation or tumour metastasis). The present DNA sequence represents a Campylobacter jejuni

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents the Campylobacter jejuni cst-I gene which encodes alpha-2,3-sialyltransferase. The alpha-2,3-sialyltransferase protein is useful for producing desired carbohydrate structures by contacting the acceptor molecule (which has a terminal galactose residue) with an activated sialic acid molecule. The terminal galactose residue linked to a second residue (Glc or a GlcNac, or GlcNac or GalNac) in the acceptor molecule through a beta-1,3 or beta-1,4 linkage, respectively. The activated stalic acid is GMP-NeuSac. The polynucleotides and polypeptides facilitate the improved production of desired structures and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 13

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention comprises nucleotide sequences (genes) from the genome of nontypeable strain of Haemophilus influenzae (NTHi). The NTHi DNA sequences of the invention are useful for treating or preventing NTHi bacterial infections of the middle ear and/or nasopharynx. The present nucleic acid represents an NTHI DNA sequence of the invention.

ORGANISM: Campylobacter jejuni
ORGANISM: Campylobacter jejuni
ORGANISM: (1)..(876)
LOCATION: (1)..(876)
OTHER INPORMATION: Lampylobacter sialyltransferase
OTHER INFORMATION: Campylobacter sialyltransferase
OTHER INFORMATION: strain OH4384 (ORF 7a of LOS biosynthesis locus)

```
TYPE: DNA
ORGANISM: Campylobacter jejuni
ORGANISM: Campylobacter jejuni
ORGANISM: (17.676)
NAME/KEY: CDS
OTHER INFORMATION: bifunctional alpha-2,3/alpha 2,8-sialyltransferase
OTHER INFORMATION: campylobacter sialyltransferase of OTHER INFORMATION: campylobacter sialyltransferase of OTHER INFORMATION: campylobacter sialyltransferase of OTHER INFORMATION: campylobacter sialyltransferase of OTHER INFORMATION: strain OH4384 (ORF 7a of lipooligosaccharide (LOS)
OTHER INFORMATION: biosynthesis locus)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      132
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          192

Sequence 1, Application US/09816028A;
Patent No. 6699705

GENERAL INPORMATION:
APPLICANT: Wakarchuk, Warren W.
APPLICANT: Wakarchuk, Warren W.
APPLICANT: Wational Research Council of Canada
TITLE OF INVENTION: Campylobacter Glycosyltransferases for Biosynthesis of
TITLE OF INVENTION: Gangliosides and Ganglioside Mimics
TITLE OF INVENTION: Ganglioside and Ganglioside Mimics
FILE REFERENCE: 019633-000111US
CURRENT PAPLICATION NUMBER: US 60/118,213
FRIOR APPLICATION NUMBER: US 60/118,213
FRIOR FILING DATE: 2000-01-31
NUMBER OF SEQ ID NOS: 49

Patent No. 6825019

GENERAL INFORMATION:
APPLICANT: GAIDEL, Michel
APPLICANT: Wakarchuk, Warren W.
APPLICANT: National Research Council of Canada
APPLICANT: National Research Council of Canada
TITLE OF INVENTION: Campylobacter Glycosyltransferases for Biosynthesis of
TITLE OF INVENTION: Campylobacter Glycosyltransferases for Biosynthesis of
TITLE OF INVENTION: Gangliosides and Ganglioside Mimics
FILE REFREENES: 102633-000111US
CURRENT APPLICATION NUMBER: US/09/816,028
PRIOR APPLICATION NUMBER: US 60/118,213
PRIOR APPLICATION NUMBER: US 60/118,213
PRIOR FILING DATE: 2000-01-31
PRIOR FILING DATE: 2000-01-31
NUMBER OF SEQ ID NOS: 49
SOFTWARE: PatentIn Ver. 2.1
SEQ ID NO 1
LENGTH: 11474

ORGANISM: Campylobacter jejuni
ORGANISM: Campylobacter jejuni
FRATURE:
NAME/KEY:
LOCATION: (1)..(876)
OTHER INFORMATION: bifunctional alpha-2,3/alpha 2,8-sialyltransferase
OTHER INFORMATION: Campylobacter sialyltransferase II (cstII) from C. jejuni
OTHER INFORMATION: seroctype 0:10 (ORF 7a of lipooligosaccharide (LOS)
                                                                                                                                                                                           609
                                                                                                                                                                                                                                                                        223

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               LOCATION: (1)..(876)
OTHER INFORMATION: bifunctional alpha-2,3/alpha 2,8-sialyltransferase
OTHER INFORMATION: Campylobacter sialyltransferase II (cstII) from C. jejuni
OTHER INFORMATION: serotype 0:10 (ORF 7a of LOS biosynthesis locus)
                                                                                     Sequence 4. Application US/09495406

Patent No. 650344

GENERAL INFORMATION:

APPLICANT: Gilbert, Michel

APPLICANT: Gilbert, Michel

APPLICANT: Watschuk, Warren W.

APPLICANT: Watschuk, Warren Council of Canada

TITLE OF INVENTION: Campylobacter Glycosyltransferases for Biosynthesis of

TITLE OF INVENTION: Gangliosides and Ganglioside Mimics

TITLE OF INVENTION: Gangliosides and Ganglioside Mimics

TITLE OF INVENTION: Campylobacter Glycosyltransferases for Biosynthesis of

TITLE OF INVENTION: Campylobacter Glycosyltransferases

TITLE OF INVENTION: Campylobacter Glycosyltransferases

TITLE OF INVENTION: Campylobacter Glycosyltransferases

TITLE OF INVENTION: Campylobacter Glycosyltransferases

TITLE OF INVENTION: Campylobacter Glycosyltransferases

TITLE OF INVENTION: Campylobacter Glycosyltransferases

Sequence 2, Application US/09816028A
Patent No. US20020042369A1
GENERAL INFORMATION:
APPLICANT: Gilbert, Michel
APPLICANT: Wakarchuk, Warren W.
APPLICANT: Wakarchuk, Warren W.
APPLICANT: National Research Council of Canada
APPLICANT: Wational Research Clycosyltransferases for Biosynthesis of
TITLE OF INVENTION: Campylobacter Glycosyltransferases for Biosynthesis of
TITLE OF INVENTION: Gangylosides and Ganglioside Mimics
TITLE OF INVENTION OF 19933-00111US
CURRENT APPLICATION NUMBER: US 60/118,213
PRIOR APPLICATION NUMBER: US 60/118,213
PRIOR APPLICATION NUMBER: US 09/495,406 RESULT 1 US-09-816-028A-2

TYPE: DNA
ORGANISM: Campylobacter jejuni
ORGANISM: Campylobacter jejuni
ORGANISM: Campylobacter jejuni
LOCATION: (1). (876)
OTHER INFORMATION: bifunctional alpha-2,3/alpha 2,8-sialyltransferase
OTHER INFORMATION: Campylobacter sialyltransferase II (cstII) from C. jejuni
OTHER INFORMATION: strain OH4384 (ORF 7a of lipooligosaccharide (LOS)
OTHER INFORMATION: biosynthesis locus)

Lubratited (08-SEP-2000) Genoscope - Centre National de Sequencage, 2 rue Gaston Cremieux, CP 5706, 91057 EVRY cedex - FRANCE (E-mail : seqrefégenoscope.cns.fr - Web: www.genoscope.cns.fr)
This GSS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces ervazzii, Zygosaccharomyces rouxii, Saccharomyces Rluyveromyces thermoclolerans, Kluyveromyces lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ::: ||| :::

//clone_lib="Plasmodium falciparum 3D7 asexual cDNA"
//note="vector: paluescript SK plus; Site_1: EcoRI; Site_2:
Xhoī; Library was constructed by Debopam_Chakrabarti.
Total RNA samples were isolated from mixed stage
saponin(0.1%)-lysed P. falciparum 3D7 infected
erythrocytes by the acidic guanidinlum-phenol chloroform
method. The poly A+ RNA was isolated by the polyAT-Tract
mRNA isolation system (Promega, WI) using streptavidin
Magnesphere particles. Directional cDNA libraries were
constructed by oligo d(T) priming of poly(A)+ RNA (Smg)
into EcoRi and XhoI sites of I zapiI vector using the Zap
cDNA synthesis kit (Stragene, CA). The average size of the
clones were mass excised using the Exhssist heblper phage
(Stratagene), the phagemids were precitptated with PEG
8000 and extracted with phenol/chloroform. Phagemid DNA
was electroporated into DH10B cells."

/deav stages"Assxual blood stages"
//dev stages"Assxual blood stages"
//lab_nost="E. coli XL-1 Blue"
//clone lib="PyBS"
//note="Vector: pAD-GAL4; At 20-25% parasitemia, blood was collected from BALBACB9D mice infected with Pyl7XL parasites, and leukocytes removed by passage over microcrystalline cellulose collumns. Total RNA was isolated using the guandidhium isothiocyanate method, and mRNA isolated using oligo(dT)-cellulose chromatography. First strand conNA synthesis was completed using a 50-base primer and reverse transcriptase in the presence of 5-methyl dCTP. After second strand synthesis, uneven termini were treated with Pfu DNA polymerase and EcoRI adaptors ligated to the blunt ends. The sample was cleaved with XhoI and separated on a Sephacryl S-500 column. Size-fractionated CDNA was precipitated and ligated to HybrizAP mans directionally using EcoRI-XhoI cleaved arms. After packaging, the phagemid vector (pAD-CAL4) was exclased from the HybriZAP vector and plasmid DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       BM167106 774 bp mRNA linear EST 04-DEC-2001

Xho1; The library was constructed by R Haywood. CDNAs were
synthesized from ganetocyte poly(A)+ RNA by Oilgo d(T)
priming, size-selected and directionally cloned into the
EcoRi (5' end) to XhoI (3' end) sites of the Uni-ZAP XR
lambda vector (Stratagene). The primary library was mass
excised as phagemid using the ExAssist helper phage
(Stratagene). Clones were mass excised using the ExAssist
helper phage (Stratagene), the phagemids were precitptated
with PEG 8000 and extracted with phenol/chloriform.
Phagemid DNA was electroporated into DH108 cells. Clone

Clones are derived from the Entamoeba histolytica HM1:IMSS sheared
DNA library
Seq primer: M13-Reverse
Class: shotgun
High quality sequence start: 39
High quality sequence stop: 856.
                                                                                                                                                                                                                                                                                                                                                         /db xref="taxan:5759"

/clone lib="Entamoeba histolytica Sheared DNA"
/clone lib="Wetcor: pHOS1; Site=1: BRI j. Constructed at The
Institute for Genomic Research (TIGR), Rockville, MD.
Genomic DNA isolated from broth cultures of E. histolytica
using a method described by Clark and Diamond (Clark,
C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a
method for isolate identification. Exp. Parasitol.
77:450.). The DNA was mechanically sheared to give a
tight size distribution (~2 kb). The v + i method used for
the library construction is described in detail in Smith,
H.O. and Venter, J.C. (Making small insert libraries for
whole genome shotgun sequencing projects. In Genome
Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barell, Oxford University Press, 1999)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |||||||

Genomic DNA isolated from broth cultures of B. histolytica using a method described by Clark and Diamond (Clark, C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a method for isolate identification. Exp. Parasitol. 77:450.). The DNA was mechanically sheared to give a tight size distribution (~2 kb). The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Maxing small insert libraries for whole genome shotqun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."

//CLOURT TYPED GALA; At 20-25% parasitemia, blood was collected from BALB/CByJ mice infected with Py17XL parasites, and leukocytes removed by passage over microcrystalline cellulose collumns. Total RNA was isolated using the guanidinium isothiocyanate method, and mRNA isolated using oligo (dT)-cellulose chromatography. First strand cDNA synthesis was completed using a 50-base primer and reverse transcriptase in the presence of 5-methyl dCTP. After second strand synthesis, uneven termini were treated with Pfu DNA polymerase and EcoRI adaptors ligated to the blunt ends. The sample was cleaved with And and separated on a Sephacryl S-500 column. Size-fractionated cDNA was precipitated and ligated to HybriZAP arms directionally using EcoRI-XhoI cleaved arms. After packaging, the phagemid vector (pAD-GAL4) was excised from the HybriZAP vector and plasmid DNA isolated."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               102
